Computer Science Engineer with 2 years of experience as a Software Developer at Orbits India. Proficient in full-stack development (React.js, Node.js, SQL, Android) and IoT solutions integrating hardware and software. Skilled in building applications with Arduino, Raspberry Pi, and embedded Android boards. Recognized innovator, awarded **1st Prize** for developing *MEDIDISPENSE*, an IoT-based medication dispenser currently under active design. Eager to contribute to innovative projects that bridge technology and real-world problem solving.

Software Developer

Orbits India | 2023 – Present

- Developed and deployed CRM systems, **car parking solutions with ANPR**, NFC-based kiosk payment systems, turnstile gate control apps, and custom Android applications.
- Worked on **embedded Android boards and electronic boards** for hardware-integrated solutions.
- Designed and maintained **responsive web applications** using **React.js, SQL, Node.js, jQuery** and **WebSockets** for real-time updates.
- Collaborated with cross-functional teams to deliver **client-ready software** with optimized performance.

-
- React.js, Node.js, jQuery
 - REST APIs
 - Websockets & Real-time Systems
 - Java, Kotlin, Android Development

- Android Dev Boards, Arduino, Raspberry Pi, ESP32
- Sensor Integration , Embedded Linux , GPIO control
- Git, VS Code, Android Studio
- Problem-solving, Cross-functional Collaboration

Education

Bachelor of Computer Science (Pursuing, Final Year)

*Yadavrao Tasgaonkar Institute of Engineering & Technology (YTIET),
Bhivpuri, India*
(Expected Graduation: 2026)

Diploma in Computer Science

Bharati Vidyapeeth College of Engineering, Kharghar, India | 2023

Projects & Achievements

MEDIDISPENSE – IoT Automated Medication Dispensing System (Design Stage)

- Engineered a full-stack IoT medication dispensing device integrating Raspberry Pi, stepper motors (28BYJ-48), buzzer alerts, and sensor-based pill detection with a real-time web dashboard built on React.js and [Node.js](#)
- Designed a 4-compartment motorized dispensing mechanism with scheduled delivery, achieving accurate pill release via programmed stepper motor sequences and GPIO control
- Built inventory management system with low-stock threshold alerts, dispensing history logs, and patient compliance tracking accessible through a responsive web interface
- Implemented safety-critical features: manual override mode, offline fallback operation, and configurable dosage scheduling for multi-patient support
- Won 1st Prize at national-level Hackathon and Project Competition; future development plan with focused enhancements including AI pill verification via computer vision and prescription OCR

Car Parking System with ANPR (Office Project)

- Android-based car parking management with Automatic Number Plate Recognition.
- Integrated electronic boards for real-time gate control.

NFC Payment System for Kiosks *(Office Project)*

- Developed **NFC-based payment solution** for kiosks with integration to payment gateways.
- Worked on kiosk hardware-software integration for seamless, secure transactions.

Turnstile Gate & Admin Dashboard *(Office Project)*

- Built an **Android application** to control turnstile gates for office access management.
- Developed an **admin dashboard** hosted from Android, accessible via web for real-time monitoring and control.
